Line 48-53.

A 34-year-old woman with a history of severe obesity and psychotic depression in therapy with lurasidone (92.5mg/day) for four months, and chronic therapy with low dosages of promazine (14mg/day) presented to our emergency department for a three-day history of bilateral foot-drop and painful swelling of the legs. The evening prior to symptom onset, the patient reported a five-kilometer flat walk, which was rather unusual for her otherwise sedentary routine and unprecedented since the time she began lurasidone therapy.

Line 125–128.

After careful consideration, we believe that the patient’s prior long-term exposure to promazine, along with the very low-dosages and its shorter half-life, make it improbable that promazine had a substantial concomitant impact on the event (Adverse Drug Reaction Probability Scale = −1), although a drug interaction effect with lurasidone cannot be excluded.

Line 148.

We thank Dr. Federico Montini for helpful suggestion.
